

**AUTOMATICALLY GENERATED SYMBOL-BASED DEBUG SCRIPT
EXECUTABLE BY A DEBUG PROGRAM FOR SOFTWARE DEBUGGING**

BACKGROUND OF THE INVENTION

5

1. Technical Field:

The present invention relates generally to the field of computer systems and, more specifically to computer systems including a method, system, and product for automatically generating a symbol-based debug script which is executable by a debug program for debugging a software program.

2. Description of Related Art:

15 New programs created by a user often include one or more inadvertent errors. Locating and removing the errors in a program is generally known in the industry as "debugging" the program, with errors being referred to as "bugs".

20 Debugging a program can be difficult and time-consuming. In the prior art of debugging a program, a user may first read the program line-by-line to try and locate the errors. Following the flow of a program by reading it line-by-line is difficult, even for a relatively simple program.

25 Because debugging programs by reading them is so difficult, software debug commands executed by a software debug program may be utilized. Debug commands may be executed on the program and the user may observe the results as an aid to locate and correct any errors. For example, a user may go through the software program to be debugged and the user may insert a breakpoint in the

Page 6 of 6

Docket No. AUS920000939US1

program to halt execution whenever the line on which the breakpoint is set is encountered. The debug commands may then be executed on the user's program. In this example, the program will execute until a breakpoint is
5 encountered. The execution of the program then will be stopped. The user may check register and other values after the breakpoint is encountered in order to evaluate the execution of the user program. This procedure is also very time-consuming when the software to be debugged
10 is more than a few lines of code.

The problem of debugging user programs is magnified when software engineers are required to isolate and solve problems which occur in vast amounts of code with which the engineers have little or no previous experience.
15 Often, standard regression tests written for the code may run successfully, but have a failure when the software is executed with slightly different parameters or environment settings.

A software program typically includes parameters
20 which may be set by a user prior to executing the software program. The software program may execute correctly when a standard set of parameters is utilized, and thus, the standard regression tests may run successfully. The same software program may execute
25 incorrectly when a slightly different set of parameters is utilized. Thus, the software engineer may be faced with a difficult problem which must be solved in a short amount of time.

Therefore, a need exists for a method, system, and
30 product for automatically generating a debug script which is executable by a debug program for debugging a user's software program.

0954050749550

SUMMARY OF THE INVENTION

The present invention is a method, system, and product for automatically generating a debug script which is executable by a debug program and used to debug a software program. The debug script automatically inserts breakpoints into the user's program. When a breakpoint is encountered during the execution of the program, the last function to be called is recorded in a log file along with one or more return codes. In this manner, the log file records the order in which the software program executed along with the various return values. In this manner, a software engineer may locate and correct bugs in the user program utilizing the debug program which is executing the debug script.

First, the user program is executed utilizing an environment including parameters which are known to result in the software program executing properly. A first log is produced during the execution of the user program using the known, good environment which indicates the order in which the user program executed when the program executed properly and which includes the return codes which are returned when the program executes correctly. The first log will include each function symbol, or function call, which represents each function executed by the user program as well as one or more return codes. Further, these function symbols will appear in the log in the order in which their corresponding functions were executed. Thus, the first log includes an example of one correct order of execution of the user program and the return codes which are returned when the program executes correctly. Next, the

Docket No. AUS920000939US1

user program is executed utilizing a second environment with parameters which are known to result in the software program executing incorrectly. A second log is then produced during the execution of the user program using
5 the second environment which indicates the order in which the user program executed when the program did not execute properly and which includes the return codes which were returned. Finally, the software engineer may then compare the two logs to analyze any differences
10 which occur in the order of execution of the functions and any differences in the return codes. In this manner, the software engineer may determine where the second log varied from the first log and may use this information in order to isolate the bugs which are causing the user
15 program to execute incorrectly using the second environment.

The debug script automatically inserts a breakpoint into the user program to halt the execution of the user program after the program executes a function which is
20 represented by each function symbol included in the user program. A function symbol may also be called a function call. Software programs include human readable function symbols which represent functions which may be called by the software program when the software program is
25 executed. When each function is executed by the user program, the breakpoint inserted by the debug script for the function symbol which represents the function will halt execution of the user program, and record the function symbol in a log. The user program then
30 continues execution until another function is encountered. In this manner, when the user program has finished executing, the log will include each function

093409-05404

Docket No. AUS920000939US1

symbol which represents each function which was executed by the user program, as well as the order in which these functions were executed.

In order to generate a debug script which inserts
5 breakpoints for each function symbol, the present invention first identifies all of the function symbols included in the user program. One method for identifying function symbols is to compile the software program utilizing an execution option which will include a
10 listing of all of the function symbols grouped together in the compiled code. These function symbols may then be dumped out from the compiled code into a file.

The debug script is then automatically generated by retrieving the first function symbol from the file,
15 inserting the function symbol into code which sets a breakpoint when this function symbol is encountered, generating code which will log this function symbol, and generating code which will cause the user program to continue executing. Therefore, when a function is called
20 by the software program during debugging, the debug script will halt the execution of the software program utilizing the breakpoint, the function's corresponding function symbol will be recorded in the log, and the execution of the software program will be then continued.

25 The above as well as additional objectives, features, and advantages of the present invention will become apparent in the following detailed written description.

0364409-0340

BRIEF DESCRIPTION OF THE DRAWINGS

The novel features believed characteristic of the invention are set forth in the appended claims. The invention itself, however, as well as a preferred mode of use, further objectives and advantages thereof, will best be understood by reference to the following detailed description of an illustrative embodiment when read in conjunction with the accompanying drawings, wherein:

10 **Figure 1** is a pictorial representation which depicts
a data processing system in which the present invention
may be implemented in accordance with a preferred
embodiment of the present invention;

Figure 2 is a block diagram of a data processing
15 system in which the present invention may be implemented;

Figure 3 is a high level flow chart which depicts the debugging of a software program utilizing a debugger which is executing an automatically generated script in accordance with the present invention;

20 **Figure 4** is a high level flow chart which illustrates the generation of a debug script which may be executed by a debug program to analyze the execution of a software program in accordance with the present invention; and

25 **Figure 5** is a high level flow chart which depicts a
debug program executing the debug script in accordance
with the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

A preferred embodiment of the present invention and its advantages are better understood by referring to the
5 figures, like numerals being used for like and corresponding parts of the accompanying figures.

The invention is preferably realized using a well-known computing platform, such as an IBM RS/6000 server running the IBM AIX operating system. However, it
10 may be realized in other popular computer system platforms, such as an IBM personal computer running the Microsoft Windows operating system or a Sun Microsystems workstation running operating systems such as UNIX or LINUX, without departing from the spirit and scope of the
15 invention.

With reference now to the figures and in particular with reference to **Figure 1**, a pictorial representation of a data processing system in which the present invention may be implemented is depicted in accordance with a
20 preferred embodiment of the present invention. A computer **100** is depicted which includes a system unit **102**, a video display terminal **104**, a keyboard **106**, storage devices **108**, which may include floppy drives and other types of permanent and removable storage media, and
25 mouse **110**. Additional input devices may be included with personal computer **100**, such as, for example, a joystick, touchpad, touch screen, trackball, microphone, and the like. Computer **100** can be implemented using any suitable computer, such as an IBM RS/6000 computer or
30 IntelliStation computer, which are products of International Business Machines Corporation, located in Armonk, New York. Although the depicted representation

09864409 DEPT

Docket No. AUS920000939US1

shows a computer, other embodiments of the present invention may be implemented in other types of data processing systems, such as a network computer. Computer 100 also preferably includes a graphical user interface that may be implemented by means of systems software residing in computer readable media in operation within computer 100.

With reference now to **Figure 2**, a block diagram of a data processing system is shown in which the present invention may be implemented. Data processing system 200 is an example of a computer, such as computer 100 in **Figure 1**, in which code or instructions implementing the processes of the present invention may be located. Data processing system 200 employs a peripheral component interconnect (PCI) local bus architecture. Although the depicted example employs a PCI bus, other bus architectures such as Accelerated Graphics Port (AGP) and Industry Standard Architecture (ISA) may be used. Processor 202 and main memory 204 are connected to PCI local bus 206 through PCI bridge 208. PCI bridge 208 also may include an integrated memory controller and cache memory for processor 202. Additional connections to PCI local bus 206 may be made through direct component interconnection or through add-in boards. In the depicted example, local area network (LAN) adapter 210, small computer system interface SCSI host bus adapter 212, and expansion bus interface 214 are connected to PCI local bus 206 by direct component connection. In contrast, audio adapter 216, graphics adapter 218, and audio/video adapter 219 are connected to PCI local bus 206 by add-in boards inserted into expansion slots. Expansion bus interface

Docket No. AUS920000939US1

214 provides a connection for a keyboard and mouse adapter 220, modem 222, and additional memory 224. SCSI host bus adapter 212 provides a connection for hard disk drive 226, tape drive 228, and CD-ROM drive 230. Typical PCI local
5 bus implementations will support three or four PCI expansion slots or add-in connectors.

An operating system runs on processor 202 and is used to coordinate and provide control of various components within data processing system 200 in **Figure 2**. The
10 operating system may be a commercially available operating system such as Windows 2000, which is available from Microsoft Corporation. An object oriented programming system such as Java may run in conjunction with the operating system and provides calls to the operating
15 system from Java programs or applications executing on data processing system 200. "Java" is a trademark of Sun Microsystems, Inc. Instructions for the operating system, the object-oriented programming system, and applications or programs are located on storage devices, such as hard
20 disk drive 226, and may be loaded into main memory 204 for execution by processor 202.

Those of ordinary skill in the art will appreciate that the hardware in **Figure 2** may vary depending on the implementation. Other internal hardware or peripheral
25 devices, such as flash ROM (or equivalent nonvolatile memory) or optical disk drives and the like, may be used in addition to or in place of the hardware depicted in **Figure 2**. Also, the processes of the present invention may be applied to a multiprocessor data processing
30 system.

For example, data processing system 200, if optionally configured as a network computer, may not

0086409-0544
T01259-6049860

include SCSI host bus adapter **212**, hard disk drive **226**, tape drive **228**, and CD-ROM **230**, as noted by dotted line **232** in **Figure 2** denoting optional inclusion. In that case, the computer, to be properly called a client

5 computer, must include some type of network communication interface, such as LAN adapter **210**, modem **222**, or the like. As another example, data processing system **200** may be a stand-alone system configured to be bootable without relying on some type of network communication interface,

10 whether or not data processing system **200** comprises some type of network communication interface. As a further example, data processing system **200** may be a personal digital assistant (PDA), which is configured with ROM and/or flash ROM to provide non-volatile memory for

15 storing operating system files and/or user-generated data.

The depicted example in **Figure 2** and above-described examples are not meant to imply architectural limitations. For example, data processing system **200** also

20 may be a notebook computer or hand held computer in addition to taking the form of a PDA. Data processing system **200** also may be a kiosk or a Web appliance.

The processes of the present invention are performed by processor **202** using computer implemented instructions,

25 which may be located in a memory such as, for example, main memory **204**, memory **224**, or in one or more peripheral devices **226-230**.

Figure 3 is a high level flow chart which depicts the debugging of a software program utilizing a debugger

30 which is executing an automatically generated script in accordance with the present invention. The process

Docket No. AUS920000939US1

starts as depicted by block **300** and thereafter passes to block **302** which illustrates the writing of a software program. Next, block **304** depicts the compilation of the software program utilizing the option necessary to
5 generate compiled code having all of the function symbols which are included in the software program grouped together in the compiled code. For example, when compiling C code, the "-g" option will generate compiled code having all of the function symbols listed together
10 at the beginning of the compiled code.

Thereafter, block **306** depicts dumping out all of the function symbols from the saved compiled code into an output file. For example, the UNIX command, "dump-lvt", will output all of the function symbols which were listed
15 at the beginning of the compiled code. Next, block **308** illustrates saving the output file. The process then passes to block **310** which depicts generating a debug script utilizing the output file. The process for generating a debug script is described more fully with
20 reference to **Figure 4**. Block **312**, then, illustrates a debug program executing the debug script to analyze the software program. The process of executing the debug script by the debug program is more fully described with reference to **Figure 5**. The process then terminates as
25 depicted by block **314**.

Figure 4 is a high level flow chart which illustrates the generation of a debug script which may be executed by a debug program to analyze the execution of a software program in accordance with the present
30 invention. The process starts as depicted by block **400** and thereafter passes to block **402** which illustrates getting a first function symbol from the output file.

0956409 0956409

Docket No. AUS920000939US1

Next, block **404** depicts the generation of code which will set a breakpoint for this function symbol so that the execution of the software program by the debug program will stop when the function represented by this function symbol is called by the software program. The process then passes to block **406** which illustrates the generation of code which will record this function symbol in a log. Next, block **408** depicts a determination of whether or not another function symbol exists in the output file. If there are more function symbols in the output file, the process passes to block **410** which illustrates getting the next function symbol from the output file. The process then passes back to block **404**. Referring again to block **408**, if a determination is made that no more function symbols exist in the output file, the process terminates as illustrated by block **412**.

Figure 5 is a high level flow chart which depicts a debug program executing the debug script in accordance with the present invention. The process starts as depicted by block **500** and thereafter passes to block **502** which illustrates setting parameters and settings for a known good environment. The term "environment" is used herein to mean the software program executing with a particular set of parameters and settings, where the software program is known to execute correctly with these settings and parameters. Next, block **504** depicts testing this environment by executing the software program with the particular settings and parameters utilizing the debug program which is executing the debug script. Block **506**, then, illustrates the software program calling a next function during execution of the software program by the debug program. Thereafter, block **508** depicts the

Referring again to block **512**, if a determination is made that the software program has finished executing under the control of the debug program, the process passes to block **516**. Block **516** depicts a determination of whether or not to test another environment. If a determination is made that another environment is to be tested, the process passes to block **518** which illustrates defining parameters and settings for the next environment to be tested. The process then passes back to block **504**.

It is important to note that while the present invention has been described in the context of a fully functioning data processing system, those of ordinary skill in the art will appreciate that the processes of the present invention are capable of being distributed in

Docket No. AUS920000939US1

the form of a computer readable medium of instructions and a variety of forms and that the present invention applies equally regardless of the particular type of signal bearing media actually used to carry out the
5 distribution. Examples of computer readable media include recordable-type media, such as a floppy disk, a hard disk drive, a RAM, CD-ROMs, DVD-ROMs, and transmission-type media, such as digital and analog communications links, wired or wireless communications
10 links using transmission forms, such as, for example, radio frequency and light wave transmissions. The computer readable media may take the form of coded formats that are decoded for actual use in a particular data processing system.

15 The description of the present invention has been presented for purposes of illustration and description, and is not intended to be exhaustive or limited to the invention in the form disclosed. Many modifications and variations will be apparent to those of ordinary skill in
20 the art. The embodiment was chosen and described in order to best explain the principles of the invention, the practical application, and to enable others of ordinary skill in the art to understand the invention for various embodiments with various modifications as are
25 suited to the particular use contemplated.
